PROPOSAL BRIEF

TO: The Executive Boards, SmartBridge India & SmartBridge Ghana
FROM: Techbridge University College, ICT Division
DATE: 7 May 2026
REFERENCE: TUC-ICT-PROP-2026-002
SUBJECT: Sovereign Deployment Framework for Ghana's One Million Coders Programme

1. STRATEGIC VISION

Techbridge University College proposes a structured alliance with SmartBridge — delivered through SmartBridge Educational Services Ltd. (Ghana), under the strategic direction of SmartBridge Education Services Pvt. Ltd. (India) — to serve as the unified technical and operational partner for the One Million Coders Programme in Ghana. This proposal sets out the framework, delivery model, and projected outcomes of a three-entity collaboration designed to transform the initiative from a generic skills-delivery exercise into a nationally-aligned programme of industrial and digital capacity building.

SmartBridge India provides the Skill Wallet platform — a proven experiential learning ecosystem that has trained 2 million+ learners across 3,000+ institutions globally over more than a decade. SmartBridge Ghana, headquartered in Accra, manages in-country deployment and government liaison. Techbridge University College provides the institutional anchor: established local infrastructure, validated delivery experience, active operational capacity of 15,000+ enrolled students, and proven alignment with national digital policy.

This alliance moves beyond the standard SaaS procurement model. By combining SmartBridge's Skill Wallet platform and global experiential learning methodology with Techbridge's institutional infrastructure and regional reach, the partnership creates a delivery model that is simultaneously world-class in technical capability and sovereign in its operation.

3. PROGRAMME DELIVERY AND OPERATIONAL SYNERGY

The alliance will operate under a Sovereign Execution Model structured across three complementary entities. SmartBridge India provides the Skill Wallet platform, global curriculum engine, and AI-native tutoring systems (Kibo bots for knowledge support). SmartBridge Ghana manages in-country implementation, government liaison, and regulatory alignment. Techbridge provides physical campus infrastructure, accredited degree programmes, and sovereign data stewardship under Ghana Data Protection Act compliance. This tripartite structure is aligned around four core operational principles:

- **Joint Curriculum Engineering:** SmartBridge's global algorithmic learning engine will be merged with Techbridge's industrial design frameworks, producing a curriculum that is technically rigorous and contextually relevant to Ghana's economic priorities. Content development will be jointly owned and locally hosted.
- **Physical Infrastructure Utilisation:** Techbridge's campuses will serve as hands-on industrial laboratories, providing equipment-based learning that complements the digital delivery platform. This is particularly critical for the Jewellery Design, Fashion Technology, and Product Engineering tracks, where physical tools and materials cannot be replicated digitally.
- **Data Sovereignty and Compliance:** All student records, learning pathways, and assessment data for the programme's one million participants will be stored and managed within Ghanaian jurisdiction, in full compliance with the Ghana Data Protection Act. Techbridge will serve as the designated Local Data Steward under the alliance agreement.
- **National Policy Synchronisation:** Every programme KPI will be aligned with the Ministry of Trade's strategy for sectoral export development and the Ministry of Education's digital literacy targets, ensuring government accountability and a clear pathway to programme sustainability beyond the initial funding period.

4. THE FOUR SPECIALIST DEGREE PROGRAMMES

Techbridge contributes four active, accredited degree programmes to the alliance, each engineered for Ghana's emerging digital sectors. These programmes are currently operational at the Oyibi campus and provide the industrial backbone for the specialised coding tracks:

- **Product Design and Entrepreneurship:** Integrating UI/UX design methodology with AI-native product development workflows and Ghanaian market commercialisation strategies. Graduates are equipped to launch and scale digital products within the domestic SME sector.
- **Fashion Design Technology:** Combining digital textile engineering, 3D garment visualisation, and smart supply chain technology into a creative technologist's curriculum. West Africa's fashion sector is projected to generate 120,000 new artisanal roles by 2030; this programme prepares graduates to lead that transition.
- **Jewellery Design Technology:** Applying high-precision CAD/CAM modelling and generative design tools to Ghana's gold and artisan sector. The programme creates a structured pathway from traditional craft to export-grade industrial production, supporting an estimated \$450 million export potential.
- **Digital Media and Communications Design:** Equipping graduates with AI-driven storytelling, generative video production, and brand architecture skills for the West African media and advertising market. The programme draws on Techbridge's existing partnerships with Ghanaian broadcasters and digital agencies.

Each programme is structured as a four-year degree with built-in industry placements and live project briefs drawn from Ghanaian enterprises. All four are eligible for direct alignment with the One Million Coders Programme certification framework.

5. ECONOMIC IMPACT AND PROJECTIONS

The alliance model creates measurable economic value at three levels — national, sectoral, and operational — each of which is supported by independently modelled projections:

NATIONAL DIGITAL GVA

\$0.8B → \$7.0B

Projected growth in Ghana's digital Gross Value Added from 2024 to 2030, positioning Ghana as the continental benchmark for technical-vocational sovereignty.

IMPORT SUBSTITUTION

42% reduction

Projected reduction in foreign software procurement dependency over five years, generating an estimated saving of \$800 million for the Ghanaian economy.

LOCAL ECONOMIC RETENTION

60% of fees

Proportion of programme service fees retained within Ghana's domestic economy through local hiring, infrastructure investment, and tax contributions — versus near-total capital flight under direct international procurement.

ALLIANCE COST EFFICIENCY

GHS 455M vs GHS 840M

Estimated 45 per cent cost reduction against equivalent direct international procurement, whilst maintaining full technical capability and programme scope.

The full Economic Impact Model, including year-by-year GVA trajectory, sectoral contribution breakdown, and workforce absorption projections, is available in the accompanying digital presentation at the reference above.

6. CONCLUSION AND CALL TO ACTION

Techbridge University College is prepared to begin deployment immediately. Our existing infrastructure, trained personnel, and active student cohort provide a platform that requires no build phase — only integration with the SmartBridge delivery engine. The full programme can be operational within eight weeks of alliance ratification.

We propose an immediate technical synchronisation workshop to finalise the Sovereign Access Node deployment plan and initiate the SME Demand Mapping audit. Following workshop agreement, joint curriculum engineering can commence within the first fortnight.

This is not a capacity-building exercise in the conventional sense. It is a structural transformation of Ghana's technical workforce — with sovereignty, accountability, and long-term export capability built into the architecture from the outset. The distinction between a domestic alliance and a direct international procurement is the distinction between a programme that builds Ghana and one that merely operates within it.

We invite the SmartBridge Executive Board to ratify this alliance and authorise commencement of Phase One.
